

## AMENDMENTS TO THE CLAIMS

**Please amend Claims 1, 7 and 8 as follows.**

1. (Currently amended) A method for distributing information to multiple users by a server via a network, the method comprising the steps of:

transmitting notice information to a destination e-mail address of a registered user whose user information, including a unique user ID and the destination e-mail address, has been stored, the notice information containing the user ID;

acquiring the user ID of the registered user and transmitting a designated Web page when the registered user clicks a banner area that is displayed on the user terminal by receiving the notice information;

receiving, from the registered user, a request for forwarding the notice information to a forwarding address of an unregistered user, the forwarding address being provided by the registered user via the Web page;

~~transmitting the notice information to the e-mail address of an unregistered user that is specified by the registered user as a forwarding address when a request for forwarding the notice information is made by the registered user via the Web page, the notice information containing the user ID;~~

acquiring the user ID of the registered user and transmitting the Web page when the unregistered user clicks a banner area that is displayed on the user terminal by receiving the notice information;

issuing a new user ID that is associated with the user ID of the registered user when a request for registration is made by the unregistered user via the Web page; and

storing user information including the new user ID and the forwarding address.

2. (Original) A method for distributing information according to claim 1, wherein the notice information transmitted by the server to the registered or unregistered

user contains information indicating the location of the Web page and being accompanied by the user ID.

3. (Original) A method for distributing information according to claim 1, wherein the notice information transmitted by the server to the forwarding address includes comment data received from the registered user.

4. (Original) A method for distributing information according to claim 1, wherein the notice information is transmitted by the server to address(es) selected from multiple forwarding addresses specified by the registered user by eliminating those stored as ones to which notice information cannot be sent.

5. (Original) A method for distributing information according to claim 1, wherein the e-mail addresses to which notice information cannot be sent include the e-mail addresses of unregistered users who have sent a notice to the effect that they do not wish to receive the notice information.

6. (Original) A method for distributing information according to claim 1, wherein the notice information is transmitted via e-mail.

7. (Currently amended) A server for distributing information to multiple users via a network, the server comprising:

- a user information memory that stores user information including unique user IDs and destination e-mail addresses;

- a notice information memory that stores notice information to be sent to users;

- a notice information transmitter that transmits the notice information to users;

- a Web page transmitter that transmits a designated Web page in response to an access by a user; and

- a user information controller that controls multiple sets of the user information; wherein:

- the notice information transmitter transmits the notice information to the destination e-mail address of a registered user, the notice information containing the user ID;

- when the registered user clicks a banner area that is displayed on the user terminal

by receiving the notice information, the Web page transmitter acquires the user ID of the registered user and transmits the Web page;

the notice information transmitter receives, from the registered user, when a request for forwarding the notice information to a forwarding address of an unregistered user is made by the registered user via the Web page, the notice information transmitter and transmits the notice information to the forwarding e-mail address, the of an unregistered user that is specified by the registered user as a forwarding address being provided by the registered user via the Web page, the notice information containing the user ID;

when the unregistered user clicks a banner area that is displayed on the user terminal by receiving the notice information, the Web page transmitter acquires the user ID of the registered user and transmits the Web page; and

when a request for registration is made by the unregistered user via the Web page, the user information controller issues a new user ID that is associated with the user ID of the registered user, and stores user information including the new user ID and the forwarding address.

8. (Currently amended) A computer readable storage medium that contains instructions to perform the following: An information distribution program that allows a server to execute the information distribution method of claim 1

transmitting notice information to a destination e-mail address of a registered user whose user information, including a unique user ID and the destination e-mail address, has been stored, the notice information containing the user ID;

acquiring the user ID of the registered user and transmitting a designated Web page when the registered user clicks a banner area that is displayed on the user terminal by receiving the notice information;

receiving, from the registered user, a request for forwarding the notice information to a forwarding address of an unregistered user, the forwarding address being provided by the registered user via the Web page;

transmitting the notice information to the forwarding address;

acquiring the user ID of the registered user and transmitting the Web page when the unregistered user clicks a banner area that is displayed on the user terminal by receiving the notice information;

issuing a new user ID that is associated with the user ID of the registered user when a request for registration is made by the unregistered user via the Web page; and

storing user information including the new user ID and the forwarding address.
